

Appendix B: Interview transcript of the final interview

Me: Hello! I have finished my app. I would be delighted if you could try it out now and tell me what you think.

Mrx xx: Hello! I will test the app with pleasure!

(After testing) **Mrx xx:** The app is much better than I initially expected! It is really intuitive, which will be important when considering the less tech-savvy teachers. There are few components and many panels. That's a big plus.

Me: I'm glad to hear that. What do you think about the functionality?

Mrx xx: The functionality is also good. I think checking attendance and marking tests is enough for most teachers. If they want to communicate with their students or other teachers, they might do it via email. Also, it's nice that all the tests, marks and attendance are fully editable in case of data entry errors.

Me: Thank you. I am flattered.

Mrx xx: Next good thing is the login panel and the login details encryption. Otherwise some students could feel tempted to change their own marks when the teacher is not in the classroom and the program is still running. I think that some of the more "curious" students could even look in the program files and find "login.txt" and "password.txt". Therefore it's good that these 2 are also additionally encrypted.

Me: Ok, go on.

Mrx xx: When it comes to the upsides of the project, one of the most important ones is the file i/o. Without it the app would make no real sense.

Me: Yeah, obviously you are right. Do you notice any drawbacks of my app?

Mrx xx: Well. I would have to think for a while.

(After a while of thinking and further testing.) **Mrx xx:** First of all, I don't like that there's absolutely no information about whether the inputted data is corrected or not and if, e.g. a new group has been created or not. It's only after checking the "all marks" panel, that I can see if a group has been added. I would like it better if I got a panel saying "success" or "failure" after every data entry. This would make data entry much easier and this feature is quite easy to implement.

Me: Ok. I actually thought about it but didn't deem it to be that important.

Mrx xx: It really is. Now, the second, and probably even more important downside of your program are the calendar and attendance panels. From what you've told me there are 50 weeks that the program can handle. Imagine using the program for the full 50 weeks and having to click 50 times to reach the last week. It is really impractical. It would be better if you could somehow make your app always start the calendar and attendance panel on the current week.

Me: Ah yes. You are right. That's a big user experience flaw in my program.

Mrx xx: If I were to be really petty, I would also make a comment about the inability to edit and remove groups. However, this is only a minor design flaw.

Me: Okay then. Do you have any more suggestions?

Mrx xx: Surely nothing important.

Me: Fine. Then do you think you will use the app in your classes?

Mrx xx: Absolutely! Even though I think I will first fix the problems with the current week in the calendar and attendance panels, I will use the app in my classes. If it works well, I will most likely extend it on my own and then present it to the principal and to other teachers. Hopefully, your app will replace our current overpriced e-register service and we will save enough money to renovate the gym. Thank you once more for your help.

Me: You're welcome. Also, thank you for allowing me to develop such an interesting project. Goodbye!

Mrx xx: Goodbye!
