

## **Criterion E: Evaluation**

### **Meeting success criteria**

1. Login panel

Met. There's a login panel. Correct login details have to be inputted to proceed.

2. Intuitive interface

Met. The number of components on each panel is small, the naming of labels is intuitive and comboBoxes are used instead of JTextFields where possible.

3. Ability to add groups and students

Met. Groups and students can be added via the "add group" panel. In case of input error, the program doesn't crash and the error is caught.

4. Ability to edit attendance of students

Met. Attendance can be easily changed for each student in the attendance panel for different days and periods.

5. Ability to add and remove tests in the calendar

Met. Tests can be added/edited in the calendar panel by clicking a day/period button and typing the name of the test and selecting a subject and group. There's also a "remove" button to remove the test.

6. Ability to mark tests

Met. Tests can be marked in the "marks" section. The marks can later be displayed in the "all marks" section.

7. File i/o with login details encryption

Met. Changes made are saved and loaded in the next session. Login data is encrypted.

## Feedback from client

In January 2020 I had the second interview<sup>1</sup> with Mrs xx during which I showed her the finished app. She liked its quite intuitive interface and the vast functionality including adding new groups, which she said is enough for most teachers. She also praised the login panel and login details encryption preventing unauthorized use by students. What's more, she said that file i/o is extremely useful since it allows her to access data on different lessons. However, Mrs. xx also had some objections. She found the lack of success/failure panels disturbing when entering data. She said some teachers might enter invalid data without this feature. Her biggest remark was about the calendar and attendance panels. In case of using the app for 50 weeks, 50 clicks would have to be made each time to reach the current week. Also, a minor dislike from her was about the inability to remove/edit group. All in all, she liked the product and will test it in her lessons.

## Recommendations for future improvements

In the future success/failure windows for data entry should be added. They are simple to implement and would provide a big benefit to user experience. A flag, initially set to true, could be added in the main class. In every catch statement the flag would be set to false. After each try/catch statement there would be an if-statement checking the flag and then the following code, where message is either "failure" or "success".

```
JOptionPane.showMessageDialog(frame, message);
```

Another recommendation would be for the calendar panel to always start at the current week. This would solve the long clicking problem. To do so a date could be saved in file "date.txt" in the format "dd/mm/yyyy". The java.time.LocalDate library could be imported and every time the program starts the method LocalDate.now() could be run. Today's date would be compared with the date in "date.txt" and later the week would be set.
