

Computer Science Internal assessment (Solution) Student hpq489	29/34
---	--------------

General comments:

This product is a start up for modern electronic dailies. We have good scenario and clearly stated client. The criteria for success are specific and testable. The design part shows clearly the process of development. There is clear evidence of algorithmic thinking and creativity. All criteria for success are addressed and the recommendations for future development are realistic. The strong part of this work is the reference to success criteria and customer expectations in all steps of creating solution.

Criterion A: Planning

Comment	[6]
The client is clearly stated and the scenario is clearly described. A very accurate transcript with conversations, discussions and notes is provided in the appendix. We have the scenario with explicit reference to key points from the client consultation. The rationale explain why it would be in the client's interest that the program is developed in Java. The criteria for success are specific and testable.	[6]

Criterion B: Solution Overview

Comment	[6]
The record of tasks contains all stages and is quite detailed. The design consists: detailed layout design sketches, input and output data from all panels of application, relationships between classes, very accurate UML diagrams and flowcharts of most interesting fragments of code and the main flowchart of the whole program. This all shows clearly the process of development. Testing plan is comprehensive, well described and follow all success criteria.	[5]

Criterion C: Development

Comment	[12]
The development part begins with an introduction that describes the functionality of each class. Then we have small index of techniques fully described in later part. All elements are well explained with support of screenshots of windows and commented source code. There is clear evidence of algorithmic thinking and creativity but in some places (e.g. login window) there is a not enough information about why the end-user put a wrong data.	[9]

Criterion D: Functionality and Extensibility

Comment	[4]
The video shows the functionality of the product in a very clear way. All success criteria are addressed and it is easily visible they are fulfilled. Video concludes with showing some specific parts in a code where program can be extended to better meet the client's future needs.	[4]

Criterion E: Evaluation

Comment	[6]
The product is evaluated against the success criteria. Recommendations for improvements are strictly based on interview with the end-user (reference to the Appendix B) and they are realistic and feasible in relation to the actual product but in my opinion the functionality of this program can be much more extended.	[5]
